Editorial

Our friend Dominique Ristori

Dominique Ristori was appointed Director General of the Joint Research Center (JRC) on 1st December 2010.

Knowing his positive mind set and his sense of creativity, I have no doubt that he gives the JRC a new impulse and even more visibility and consideration.

I recently met with Dominique Ristori.

We share a lot of memories, when he was cooperating with our Forum in his capacity as Director and Deputy Director-General in DG Energy.

I would like to thank him for accepting to answer my questions during an interview that you will find on page 3 of this Bulletin.

*Jean-Claude Charrault
Director General*

Past Events

15 November 2011 : Dinner-Debate in Strasbourg

Nuclear New Build in the EU : Going forward the Finnish way
at the invitation of Fennovoima

The speaker was Mr. Tapio Saarenpää (left on the picture), CEO of Fennovoima

He was accompanied by Mr Juhani Hyvärinen, Chief Nuclear Officer and Mrs Tiina Tigerstedt, PR and International Communications Manager who took turns in answering the questions of the audience.

"We have a wide support for the project, both nationally and at the local level. I am equally encouraged by the high degree of EU-level interest in the progress of the Fennovoima nuclear new build Project."

Tapio Saarenpää, CEO of Fennovoima

22 November 2011 : Dinner-Debate in Brussels

Reducing greenhouse gas in the EU by 80% : feasible target, realistic milestones, open technology options
at the invitation of Eurogas

Speaker: Jean-François Cirelli, President of Eurogas and Vice-Chairman and President of GDF SUEZ

"In the context of the economic crisis within the EU, gas can be considered a cost-effective solution to reach an 80% emission reductions target by 2050. The Eurogas Roadmap offers a pathway where all energy-related sectors contribute, thanks to the use of gas, along with energy efficiency, renewables, technology and behaviour change. From today to 2030, the high efficiency and low emissions of gas will make an immediate contribution. Moreover, the flexibility of gas combines perfectly with the development of renewables. The 2050 horizon requires taking into account great uncertainties, especially at the technological level. Investing now in natural gas opens up an option to go in whichever direction technology and economics may point around 2030. However, if the EU wants to remain attractive in the global gas market, it needs to be positive about the role that gas will play in its future energy mix."

Beate Raabe, Secretary General, EUROGAS

Interview with Dominique Ristori

Jean Claude Charrault interviewing Dominique Ristori, Director-General, Joint Research Centre, European Commission

JCC: How do you see the role of science in policy-making?

DR: The importance of a solid evidence base for policy-making has increased significantly over the past years. This is a direct consequence of policy files becoming more and more complex in nature, just think of biofuels or genetically modified organisms. The current financial crisis in Europe is another example, with matters requiring highly technical expertise. Policy-makers need to receive scientific facts and figures before decisions are taken. This gives science a huge opportunity, but also an enormous responsibility.

JCC: You started one year ago as Director-General of the European Commission's Joint Research Centre (JRC). How has the JRC responded to the new policy demands?

DR: Being the only Directorate-General of the Commission carrying out direct research, we have set out the clear message that the JRC is the Commission's in-house science service. With seven institutes located all over Europe, it is our role to make sure that the development, implementation and monitoring of European policies is based on the scientific state-of-the-art. While the JRC has built up a remarkable reputation in the scientific community in the past, the current economic challenges clearly demonstrated that the organisation had to become much more responsive to policy demands, providing full support to the Europe 2020 priorities. Take for instance our support to key issues such as climate change, environment, food security and nuclear safety.

JCC: Which priorities have you set for the JRC?

DR: The JRC supports the grand challenges of the future in a number of key priority areas: energy (in particular, energy efficiency, renewables, smart grids), clean transport, agriculture and food security, environment and climate change, health and consumer protection, information and communication technologies, safety and security including for nuclear. However, just being excellent in any of those areas is not enough. The key lies in connecting these fields horizontally in an interdisciplinary manner. It is for this reason that we are investing into further extending our competences in socioeconomic research and integrated modelling, making sure that the Commission has independent expertise at hand.

Interview with Dominique Ristori (continued)

Furthermore, we are building up a capacity in scientific foresight and policy anticipation. In times of accelerating societal and technological change, it is absolutely necessary to be able to look beyond the horizon and proactively inform policy-makers about issues that might require a policy response in the future.

JCC: Which role does the cooperation with partner organisations play in this context?

DR: A crucial one. While it is essential for the Commission to have its own in-house scientific advice, independent of national or private interests, we have to ensure that the expertise existing in the Member States and elsewhere is used to its full extent. This is the reason why one of my priorities has been to strengthen the JRC's networking with strategic partners in Europe and world-wide. Apart from an increased dialogue with the European Parliament and Council, this means in particular teaming up with top players in the Member States representing industry, academia and civil society. For example, we signed recently an agreement with the European Academies Science Advisory Council (EASAC), aiming at establishing closer links between EU national science academies and the policy-making processes in the EU. Likewise, we are strengthening our collaboration with partners in key international partner countries, most notably the US. Take for instance the close partnership which we are developing with the US Department of Energy on electro-mobility and smart grids, in view of promoting a joint approach among scientists and common standards between the EU and the US. And, finally, don't forget about our work for Africa: the JRC has just prepared a mapping of renewable energy in Africa in order to facilitate the use of sustainable energy sources in this continent.

JCC: And the future perspectives?

DR: The JRC will further develop scientific support to key European initiatives, such as electro-mobility, food security and eco-industries, in close cooperation with the European Institutions, other stakeholders and the scientific community, including at international level.
